## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Neutral Furnace Lining Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Neutral Furnace Lining Material is a refractory material used in industrial smelting equipment. Its main components are corundum and high-alumina bauxite, exhibiting excellent high-temperature performance, wear resistance, and corrosion resistance. It is a material that does not readily undergo significant chemical reactions with acidic or basic slags at high temperatures, making it suitable for smelting various metals and often used as a transition layer between acidic and basic furnace lining materials. Upstream applications mainly include refractory raw materials such as fused or sintered corundum, fused or sintered spinel, high-purity mullite, and various high-performance additives and binders. Downstream applications include high-temperature industries such as metallurgy and casting. Global sales volume in 2024 was approximately 950,000 tons, with an average market price of approximately US\$360 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, and the industry's gross profit margin ranges from 12% to 30%.

The global Neutral Furnace Lining Material market size was estimated at USD 342.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
