The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on New Energy Vehicle Electric Cooling Pump competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global new energy vehicle electric cooling pump production reached approximately 31323 K units, with an average global market price of around US\$ 35.6 per unit. The electric cooling pump in new energy vehicles is a fluid circulation device driven by an electric motor. It actively propels a cooling medium (such as water or oil) through the motor, inverter, battery, and its heat exchanger, thereby achieving heat transfer and temperature control, ensuring the thermal management performance and reliability of the powertrain under various operating conditions. Currently, a new round of global scientific and technological revolution and industrial transformation is booming. The integration of automotive technologies with energy, transportation, information and communications is accelerating, with electrification, connectivity, and intelligence becoming the driving trends and trends in the automotive industry. New energy vehicles integrate transformative technologies such as new energy, new materials, the internet, big data, and artificial intelligence, driving the transformation of automobiles from simple means of transportation into mobile smart terminals, energy storage units, and digital spaces. These efforts are driving the transformation and upgrading of energy, transportation, and information and communications infrastructure, optimizing energy consumption structures, and enhancing the intelligence of transportation systems and urban operations. The global market is vigorously promoting the development of energy-saving vehicles, new energy vehicles, and intelligent connected vehicles, accelerating breakthroughs in core automotive component technologies and boosting the development of the automotive component industry. In recent years, major global automotive nations have strengthened strategic planning and

policy support, while multinational automakers have increased R&D investment and refined their industrial layout. New energy vehicles have become a key driver of the global automotive industry's transformation and development, and a crucial engine driving sustained global economic growth. The increasing power density of electric vehicle traction motors generates significant heat, posing new challenges for motor heat dissipation. While water cooling technology currently meets these requirements, it suffers from significant technical drawbacks. The coolant resides in the housing's channels, not in direct contact with the motor. Heat generated within the motor is transferred through layers of material to the coolant in the housing's channels, where it is then dissipated. This constitutes indirect cooling. Because the motor lacks direct access to the coolant, heat can easily accumulate, creating localized hot spots. Furthermore, the layout of the cooling channels requires a larger motor housing. Oil, however, is non-conductive and non-magnetic, so it has no effect on the motor's magnetic circuit. Therefore, it can serve as a direct cooling medium for the motor. During operation, heat generated by the motor is transferred to the motor base via the oil, achieving cooling. Oil-cooled motors employ direct cooling, significantly reducing the motor housing size and enabling more compact designs.

The global New Energy Vehicle Electric Cooling Pump market size was estimated at USD 1115.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.70% during the forecast period.
