Abstracts

Newborn blood screening systems, also known as newborn screening (NBS), are public health programs designed to identify certain disorders in newborn babies shortly after birth. These systems involve taking a few drops of blood from a baby's heel, usually within the first 24 to 48 hours after birth, and testing it for a variety of genetic, metabolic, and developmental conditions. The tests conducted through newborn blood screening systems can vary based on location, but they often include screenings for disorders such as phenylketonuria (PKU), congenital hypothyroidism, cystic fibrosis, sickle cell disease, and many others. Early detection of these conditions allows for early intervention and treatment, which can significantly improve the baby's health outcomes and quality of life. Newborn blood screening is typically mandatory or strongly recommended in many countries as part of standard newborn care. It's an essential preventive measure aimed at early identification of potential health issues, enabling timely medical interventions that can prevent or minimize the impact of certain conditions on a child's development. Newborn blood screening systems include screening kits, consumables, instruments and software.

Market Drivers:

- Rising Prevalence of Disorders:** The increasing incidence of genetic, metabolic, and congenital disorders among newborns drives the demand for comprehensive screening systems.
- Government Initiatives:** Government-led programs mandating newborn screening in many countries promote the adoption of screening systems, ensuring early detection and intervention for better health outcomes.
- Rising Healthcare Expenditure:** Increased healthcare spending, especially in developing regions, allows for better infrastructure and accessibility to screening systems and services.

Market Restrictions:

- Cost Constraints:** High initial setup costs for screening equipment and ongoing operational expenses can limit the implementation of comprehensive newborn screening programs in certain regions or healthcare settings.
- Limited Access to Advanced Technology:** Some regions, especially in low-resource settings, may lack

access to sophisticated screening technologies, hindering comprehensive screening programs. Variability in Healthcare Policies: Differences in healthcare policies and regulations across regions can affect the standardization and uniformity of newborn screening programs.

The global Newborn Blood Screening Systems market size was estimated at USD 662.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
