Report Overview

Heel lancet, also known as a heel stick device or heel pricker, is a medical instrument used for obtaining blood samples from the heel of an infant. Heel lancets are designed for use on infants, as the heel is a common site for blood collection in newborns and young babies. The design of the lancet allows for easy access to the blood vessels in the heel. Heel lancets are designed to be minimally invasive and cause minimal discomfort to the infant. They typically have a small, sterile, and sharp blade that quickly punctures the skin to obtain the blood sample without causing excessive pain. Heel lancets often come with safety features to prevent accidental needlesticks and ensure proper sample collection. Some lancets have retractable blades or shields that cover the lancet after use, reducing the risk of injury.
