Report Overview

Batteries are considered amongst the most remarkable man-made inventions in history and have been the focus of intense investigation by both scientists and engineers across the globe. Evolving from the primitive Voltaic Pile (the first electrical battery created in 1799), which used zinc and copper electrodes and brine-soaked paper as an electrolyte, a wide range of batteries are now available in the market. Amongst these, lithium-ion (Li-ion) batteries have long been considered a breakthrough in the battery landscape, resulting in revolutionary growth in the chargeable consumer electronics industry.

It is estimated that, at present, more than one billion rechargeable Li-ion cells are produced each year to cater to the demands of the portable electronics market alone. However, despite their successful market deployment, excellent energy density and cost-effectiveness, certain limitations, such as concerns related to the use of liquid electrolytes (risk of leakage and flammability), have also been associated with Li-ion batteries. A case-in-point being Samsung's massive global recall of its Galaxy Note 7 series of mobile phones in September 2016, due to the safety issues associated with the Li-ion batteries used in them.

Bosson Research's latest report provides a deep insight into the global Next Generation Batteries market covering all its essential aspects.
