Report Overview:

An integrated circuit or monolithic integrated circuit is a set of electronic circuits on one small flat piece (or "chip") of semiconductor material, normally silicon. The integration of large numbers of tiny transistors into a small chip results in circuits that are orders of magnitude smaller, cheaper, and faster than those constructed of discrete electronic components. The IC's mass production capability, reliability and building-block approach to circuit design has ensured the rapid adoption of standardized ICs in place of designs using discrete transistors. ICs are now used in virtually all electronic equipment and have revolutionized the world of electronics. Computers, mobile phones, and other digital home appliances are now inextricable parts of the structure of modern societies, made possible by the small size and low cost of ICs.

The Global Next Generation Integrated Circuit Market Size was estimated at USD 885.75 million in 2023 and is projected to reach USD 2081.06 million by 2029, exhibiting a CAGR of 15.30% during the forecast period.
