Report Overview

A monofocal IOL is an intraocular lens with a fixed focus for one distance. A cataract doctor may select monofocal IOLs that are for near focus, for mid-distance focus, or for distant focus. Only one of these three can be selected and the focus will not change after surgery. Like your eye's natural lens, an IOL focuses light that comes into your eye through the cornea and pupil onto the retina, the sensitive tissue at the back of the eye that relays images through the optic nerve to the brain. Most IOLs are made of a flexible, foldable material and are about one-third of the size of a dime. Like the lenses of prescription eyeglasses, your IOL will contain the appropriate prescription to give you the best vision possible. The new generation monofocal IOL, designed to improve the depth of focus while fully correcting corneal spherical aberration, shows a pupil-independent improvement in simulated intermediate visual acuity and maintained distance visual acuity compared to conventional monofocal IOLs. Monofocal IOLs is the most popular intraocular lenses.
