Abstracts

Next Generation Sequencing (NGS) Service is a high-throughput sequencing technology that can quickly and efficiently sequence large amounts of DNA or RNA samples. This kind of service is widely used in genetic disease research, HLA typing, cancer research, infectious disease research and other fields. The Rise of Personalized Medicine: With advances in genomics and precision medicine, more patients and healthcare providers are beginning to realize the potential of personalized medicine. NGS services can be used for genetic testing and disease prediction, and can provide patients with personalized treatment plans, helping to improve treatment effects and patients' quality of life. Integration of big data and artificial intelligence: The amount of data generated by NGS is huge. Through big data analysis and artificial intelligence technology, these data can be better analyzed to provide more accurate diagnostic results and more effective treatment suggestions. Artificial intelligence can also help analyze complex data sets and improve the accuracy and reliability of NGS services. Development of telemedicine services: With the development of Internet and mobile communication technology, telemedicine services are gradually emerging. NGS services can be provided remotely. Patients can perform genetic testing at home, and doctors can analyze the results and provide treatment plans remotely. This provides patients with convenient and fast services and provides doctors with a broader range of services.

The global Next Generation Sequencing (NGS) Service market size was estimated at USD 6730.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 17.30% during the forecast period.
