Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on NFC Tag Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. NFC tag chip is a wireless communication chip based on RFID (radio frequency identification) technology, operating in the 13.56MHz frequency band, and realizing short-distance (usually a few centimeters) contactless data exchange through electromagnetic induction. Its core features include: Passive design: No independent power supply is required, and energy is obtained from the electromagnetic field of the reading device. Storage and communication: Built-in memory (capacity ranging from 48 bytes to 8KB) and modem support data reading and writing and two-way communication. Protocol compatibility: Complies with ISO/IEC 14443 (Type A/B), ISO 15693 and other standards to ensure cross-device interoperability. Market drivers: resonance of technology, policy and demand Technological progress Integration improvement: NFC chips are integrated with MCU and security elements to reduce costs and power consumption. Protocol standardization: NFC Forum promotes cross-device interoperability and expands the scale of the ecosystem. Policy support Digital transformation: Governments promote smart transportation and e-government, stimulating NFC demand. Safety regulations: The requirements for data encryption in the financial and medical fields have increased, promoting the application of secure NFC chips. Market demand growth Popularization of mobile payments: Contactless payments have become mainstream, and the penetration rate of NFC technology has increased. The outbreak of the Internet of Things: Billions of devices require low-power and short-distance communication, and NFC has become the preferred solution. Security needs Data encryption: NFC's short-distance communication and encryption functions (such as AES) are suitable for sensitive data transmission. Anti-copying technology: Dynamic data, digital signatures and other

technologies prevent information tampering and copying. Ecosystem integration Technology integration: NFC is combined with Bluetooth and UWB to expand scenarios such as digital keys for cars and indoor navigation. Platform support: Giants such as Apple and Google promote the integration of NFC functions into operating systems to lower the development threshold. NFC tag chips have become the core components that connect the physical world and the digital world due to their passive design, high security and protocol compatibility. International manufacturers dominate the technical standards and high-end markets, while domestic companies are gradually expanding their market share through technological innovation and cost advantages. In the future, with the deepening of scenarios such as the Internet of Things and smart cities, the application boundaries of NFC tag chips will continue to expand, promoting the prosperity and development of the industrial ecosystem.

The global NFC Tag Chip market size was estimated at USD 601.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
