Abstracts

NGS Target Enrichment Solutions refer to a set of technologies and methods used to selectively capture and enrich specific regions of DNA or RNA for sequencing in NGS applications. These solutions involve techniques such as hybridization capture, PCR-based amplification, or bead-based enrichment to isolate regions of interest (such as genes or genetic mutations) from a larger genome before sequencing. By focusing on specific targets, these solutions improve sequencing efficiency, reduce costs, and increase the depth of coverage for the regions being studied. They are commonly used in genomic research, clinical diagnostics, and personalized medicine to analyze particular genetic variants, mutations, or disease-related regions with high precision.
