## Abstracts

A nickel-base electrode is an electrode primarily composed of nickel or nickel alloys. These electrodes are used in various electrochemical applications, including batteries, fuel cells, and electrolyzers. Nickel's favorable properties, such as good electrical conductivity, corrosion resistance (especially in alkaline environments), and relatively low cost compared to noble metals like platinum, make it a suitable material for these applications. Different nickel alloys and surface modifications are often employed to enhance performance for specific uses. The industry trend for nickel-base electrodes is driven by the growing demand for energy storage and clean energy technologies. Key trends include enhancing the electrochemical performance of nickel-based materials through alloying, surface modification (e.g., coatings, nano-structuring, doping), and the development of novel electrode architectures. In batteries, research focuses on improving energy density, power density, cycle life, and safety of nickel-metal hydride (NiMH), nickel-cadmium (NiCd), and nickel-zinc (NiZn) batteries. In fuel cells and electrolyzers, the focus is on enhancing catalytic activity for reactions like oxygen evolution reaction (OER) and hydrogen evolution reaction (HER), while also improving durability and reducing cost. There is a strong emphasis on reducing or eliminating the use of scarce and expensive noble metals by developing advanced nickel-based catalysts and electrocatalysts with comparable or superior performance. Furthermore, there is a growing interest in using earth-abundant materials and sustainable manufacturing processes for electrode production to minimize environmental impact and reduce reliance on critical raw materials. The industry is also exploring novel nickel-based materials, such as nickel foams, nickel nanowires, and nickel composites, to further enhance electrode performance and expand their applications.

The global Nickel Base Electrode market size was estimated at USD 125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60%

during the forecast period.
