Abstracts

Nickel-based wear-resistant alloy plate is a wear-resistant alloy plate made of nickel as the main component and synthesized by adding other alloy elements (such as chromium, molybdenum, aluminum, iron, titanium, etc.). This alloy plate not only has excellent wear resistance, but also can withstand medium corrosion and high-temperature oxidation under specific conditions. Nickel can significantly improve the strength of the alloy while maintaining good plasticity and toughness. Nickel has high corrosion resistance to acids and alkalis, and has rust and heat resistance at high temperatures. Chromium (Cr) can improve the corrosion resistance of the alloy, especially in strong reducing corrosion environments, complex mixed acid environments and solutions containing halogen ions. Molybdenum (Mo) can enhance the wear resistance and corrosion resistance of the alloy, especially in high temperature and high pressure environments.

The global Nickel Based Wear Resistant Alloy Plate market size was estimated at USD 309.32 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
