Abstracts

Nickel coated graphite is a composite material consisting of natural or synthetic graphite particles uniformly coated with a layer of metallic nickel, engineered to enhance the electrical conductivity, thermal stability, oxidation resistance, and mechanical strength of the base graphite while retaining its inherent lubricity and thermal properties. This material is primarily utilized in applications requiring reliable electrical contact, electromagnetic interference (EMI) shielding, and thermal management, such as in conductive fillers for polymers, battery electrodes, fuel cell components, and advanced aerospace and automotive systems where performance under extreme conditions is critical. The nickel coating mitigates graphite's tendency to oxidize at high temperatures and improves compatibility with metal matrices, making it a specialized advanced material positioned at the intersection of electronics, energy storage, and high-performance engineering sectors.

The global Nickel Coated Graphite market size was estimated at USD 153.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
