Abstracts

Nitrogen-containing bisphosphonate drugs are an important class of drugs used to treat bone related diseases, and their molecular structures contain nitrogen atoms. These drugs inhibit the differentiation and maturation of osteoclasts, interfere with the process of bone resorption, and thus reduce the occurrence of bone destruction and bone related complications. They are widely used in clinical practice to treat diseases such as osteoporosis and tumor bone metastasis, and has significant anti bone resorption effects. Common types include second-generation nitrogen-containing bisphosphonates (such as pamidronate disodium, alendronate sodium), as well as third-generation nitrogen-containing bisphosphonates (such as ibandronate sodium, risedronate sodium, zoledronate sodium).

The global Nitrogen-Containing Bisphosphonate Drugs market size was estimated at USD 4000.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.90% during the forecast period.
