Abstracts

Nitrogen-doped carbon nanotubes (N-CNTs) can be produced through five main methods; chemical vapor deposition (CVD), high-temperature and high-pressure reactions, gas-solid reaction of amorphous carbon with NH₃ at high temperature, solid reaction, and solvothermal synthesis. Nitrogen doping plays a pivotal role in lithium storage, as it creates defects in the CNT walls allowing for Li ions to diffuse into interwall space. It also increases capacity by providing more favorable bind of N-doped sites. N-CNTs are also much more reactive to metal oxide nanoparticle deposition which can further enhance storage capacity, especially in anode materials for Li-ion batteries.

The global Nitrogen-doped Carbon Nanotube(N-CNTs) market size was estimated at USD 72.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
