Report Overview

Nitrogen trifluoride is an excellent plasma etching gas and cleaning agent in the microelectronics industry. Mix raw materials such as hydrogen fluoride and ammonium hydrogen fluoride to form a molten electrolyte, which is then electrolyzed in an electrolytic cell. The main product, nitrogen trifluoride, is collected in a cold trap. Impurities are removed through distillation, and the distilled product is collected and tested in a quality tank before being filled. Nitrogen trifluoride can strongly irritate the eyes, skin, and respiratory mucosa, corrode tissues, and react strongly with reducing agents, causing explosions. There are strict standards for storage and transportation, and packaging containers such as steel cylinders and bundle containers need to be used to supply to customers.

The global Nitrogen Trifluoride for Integrated Circuits market size was estimated at USD 860 million in 2023 and is projected to reach USD 1762.60 million by 2032, exhibiting a CAGR of 8.30% during the forecast period.
