### Report Overview

The NMP Rotor Recovery System mainly uses high concentration NMP gas to pass through the surface cooler, and the temperature drops to about 10 degrees. When NMP reaches saturation steam, the concentration decreases. The low concentration gas partially returns to the oven, and some passes through the rotary wheel before returning to the oven or being discharged. There is also a small amount that passes through the preheating area of the rotary wheel and then passes through the steam heat exchange area for heating. The heated gas is blown back by the rotary wheel to remove NMP from the rotary wheel (at this time, the air temperature reaches 200 °, and the saturated steam pressure increases significantly, which can adsorb more NMP steam. This rotary area is called the analysis area). The high concentration steam adsorbed NMP is recycled through the condenser to reduce the concentration.
