Abstracts

Nocturnal polyuria treatment refers to therapeutic interventions and pharmaceutical solutions aimed at managing excessive urine production during sleep, a condition characterized by an overnight urine output exceeding 20-33% of total 24-hour volume in adults. This disorder often disrupts sleep patterns and diminishes quality of life, with underlying causes including age-related changes, hormonal imbalances (such as low vasopressin levels), cardiovascular issues, or medication side effects. Treatments range from behavioral modifications (fluid management, leg elevation) to pharmacological options like desmopressin analogs, which reduce urine production by mimicking antidiuretic hormone, and diuretic timing adjustments. The condition is distinct from other causes of nocturia, such as bladder storage problems or global polyuria, requiring accurate diagnosis through frequency-volume charts and targeted therapeutic strategies.

The global Nocturnal Polyuria Treatment market size was estimated at USD 985.62 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
