Abstracts

Noise cancelling wireless bluetooth headphones reduce unwanted ambient sounds using active noise control. This is distinct from passive headphones which, if they reduce ambient sounds at all, use techniques such as soundproofing. Active noise cancellation makes it possible to listen to audio content without raising the volume excessively. It can also help a passenger sleep in a noisy vehicle such as an airliner. In the aviation environment, active noise-control headphones increase the signal-to-noise ratio significantly more than passive noise attenuating headphones or no headphones, making hearing important information such as safety announcements easier. Noise cancelling wireless bluetooth headphones can improve listening enough to completely offset the effect of a distracting concurrent activity.The growing acceptance of smart wearable devices, such as wireless headphones with active noise cancellation, enhances hearing and increases control over environmental sounds, driving the demand for active noise cancellation headphones. Rising awareness about hearing impairment, transition to hearing in connected environments, rising number of smartphone users and tech-savvy consumers, and adoption of new audio technologies are some of the salient factors expected to drive the ANC headphones market factor. The number of smartphone users worldwide has exceeded 6 billion and is expected to grow by hundreds of millions in the coming years. China, India and the United States have the largest number of smartphone users. The increasing popularity of smartphones and connected mobile phones is driving the global demand for active noise-canceling headphones. Rising penetration of digital platforms and proliferation of smart devices have enabled some music and entertainment customers to use wireless ANC headphones for better quality.
