Report Overview

Noise dosimeter, also called integral sound level meter, is an instrument used to measure noise exposure. A noise dosimeter is an integration device added to the ordinary noise dosimeter circuit. It can measure the magnitude of noise exposure over time. The noise dosimeter can be preset with time T, so that the equivalent continuous A sound level or Leq noise exposure is given together within the measurement time.

Noise Dose Meter

According to the sensitivity of noise dosimeters, there are two methods for classifying noise dosimeters. One is the ordinary noise dosimeter, which requires less microphones. The dynamic range and the frequency response are relatively narrow. Generally, band-pass filters are not used in combination. The other is a precision noise dosimeter. The microphone requires a wide frequency response, high sensitivity, and long-term stability. This kind of band-pass filter is used together, and the output of the amplifier can be directly connected to the level recorder and recorder, which can display or store the noise signal.
