Report Overview:

Noise Dosimeters also called noise meters. A Noise Dosimeter is used for acoustic (sound that travels through air) measurements. It is commonly a hand-held instrument with a microphone. The diaphragm of the microphone responds to changes in air pressure caused by sound waves. That is why the instrument is sometimes referred to as a Sound Pressure Level (SPL) Meter. A microphone is distinguishable by the voltage value produced when a known, constant sound pressure is applied. This is known as the microphone sensitivity. The instrument needs to know the sensitivity of the particular microphone being used. Using this information, the instrument is able to accurately convert the electrical signal back to a sound pressure, and display the resulting sound pressure level (decibels dB SPL). The most recent standards for Noise Dosimeters are international standard BS EN 61672:2013 or IEC 61672:2013 and these have superseded most previous standards.

The Global Noise Dosimeters Market Size was estimated at USD 84.05 million in 2023 and is projected to reach USD 103.92 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
