### Report Overview:

1/f noise, or flicker noise, is the dominant noise for deep sub-micron CMOS, BJT, FET and HBT devices. It can significantly impact the performance of analog/RF circuits. As an example, 1/f noise becomes phase noise in an oscillator and causes stable issues. A noisy LO signals can severely degrade a receiver's dynamic range and selectivity. Accurate measurement and modeling of 1/f noise are critical to analog/RF circuit designs. However, this measurement is particular difficult, since the measurement system itself can easily introduce Others noise sources. Therefore, an integrated measurement system with high stability and low system noise is absolutely critical for accurate 1/f noise measurement

The market is driven by various end-user industries, such as research institute, semiconductor enterprise and so on.

Any undesirable turbulence that corrupts an information-bearing signal is generally referred to as noise. Electrical noise is inherent in every circuit, ranging from current flowing through a resistor or transistor, to leakage current through a tantalum capacitor. To minimize its effects, it becomes necessary to measure and quantify the noise of the constituent parts, and then connect the constituent noise contributions to overall circuit performance.

The Global Noise Measurement System Market Size was estimated at USD 133.92 million in 2023 and is projected to reach USD 157.13 million by 2029, exhibiting a CAGR of 2.70% during the forecast period.
