Abstracts

The Noise and Operational Monitoring System (NOMS) is an integrated technical system that aims to dynamically monitor and manage environmental noise and equipment operating status through real-time data collection, transmission and analysis. The system relies on sensor networks (such as sound level meters, vibration sensors, etc.) to obtain noise intensity, spectrum characteristics and equipment operating parameters (such as speed, temperature, etc.), combines the Internet of Things technology to achieve remote data transmission, and uses algorithm models (such as machine learning, statistical models) to trace the source of noise pollution, abnormal operating status warning and environmental impact assessment. Its core functions include multi-source data fusion, real-time trend analysis, over-standard event alarm and decision support, and are widely used in industrial production, transportation, construction and other fields to achieve the dual goals of noise pollution prevention and control and equipment health management.

The global Noise and Operation Monitoring System (NOMS) market size was estimated at USD 770.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
