Report Overview:

The easiest method to neutralize acidic water and boost pH is to pass the water through a filter containing calcite, a naturally-occurring mineral rock consisting of approximately 95% calcium carbonate and 3% magnesium carbonate. It is commonly used in residential and commercial water treatment applications to neutralize acidic or low pH water to reduce corrosiveness, to balance pH prior to iron treatment or after reverse osmosis treatment, and to prevent corrosion and the leaching of metals from the plumbing system. Calcite is slow-acting and self-limiting. It is best used in circumstances where the pH level of the water treated is between 6.0 and 6.9. For applications where the pH level is less than 6.0, blending calcite with another media called Corosex will produce better results than calcite alone. Corosex (Magnesium oxide) is faster-acting and capable of larger pH corrections. This is especially true where high flow rates are desired.
