Abstracts

Non-captive linear actuators are electromechanical devices that convert rotational motion from a motor into linear displacement, characterized by a motor-driven screw that moves through a stationary nut, allowing the motor housing itself to travel along the axis rather than being fixed in place; these actuators are distinct from captive models, where the screw moves while the motor remains stationary, and they are commonly used in applications requiring precise, repeatable linear motion with constraints on mounting space or where the load must move relative to the motor, such as in automation equipment, medical devices, optical systems, and robotics.

The global Non Captive Linear Actuators market size was estimated at USD 1346.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
