Abstracts

The fire-retardant performance of buildings and materials is categorized into three major groups: noncombustible, quasi-incombustible, and flame-retardant. Noncombustibility refers to the ability to withstand high temperatures for a certain period. It protects a building's interior structure by preventing flame spread for a specified duration, even under direct exposure to fire. Quasi-incombustibility has similar heat resistance to noncombustibility but doesn't meet the same duration criteria. Flame-retardant materials resist flames, limiting fire spread and ceasing combustion quickly in case of a fire.

The global Non-Combustible Building Materials market size was estimated at USD 19610.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
