## Abstracts

Non-combustible panels are building materials specifically engineered to resist ignition, prevent flame spread, and limit heat transfer in the event of a fire, typically classified under fire resistance ratings such as Class A or ASTM E84 standards; these panels are composed of inorganic, mineral-based materials like magnesium oxide, calcium silicate, fiber cement, or gypsum, often reinforced with additives or mesh for structural integrity, and are utilized in both interior and exterior applications where enhanced fire safety is required, including wall cladding, ceilings, partitions, facades, and protective encasements for structural elements. The market for non-combustible panels is driven by stringent building codes, rising safety regulations, increased awareness of fire hazards in residential, commercial, and industrial construction, as well as growing demand in sectors such as healthcare, education, and infrastructure where fire resistance is a critical priority; key factors influencing the market include advancements in material technology improving durability and sustainability, cost competitiveness relative to traditional materials, and regional variations in regulatory frameworks, with growth particularly strong in urbanizing regions and areas prone to wildfires or with high insurance requirements for fire-safe construction.

The global Non Combustible Panels market size was estimated at USD 1580.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
