Report Overview

Non-contact Microscope is a microscope that can obtain high-resolution imaging without direct contact with the sample surface. It uses the principles of optics, acoustics, and electromagnetics to image, scans or projects a certain signal onto the sample, and then obtains the shape, structure, composition and other information of the sample according to the characteristics of the signal such as reflection, scattering, and transmission. Compared with traditional microscopes, non-contact microscopes can avoid damage to samples caused by contact, and can also observe some samples that cannot be observed by traditional microscopes, such as thin films and nanomaterials.
