Abstracts

A non-contact passive sensor is a sensor device that does not require direct contact with the object being measured and does not rely on an external power supply. It senses or detects the target signal by utilizing the physical or electromagnetic characteristics of the external environment (such as temperature, humidity, electric field, magnetic field, etc.) and converts it into a usable output signal. Passive sensors complete data acquisition and transmission by self-excitation or drawing energy from external signals. Therefore, they have the characteristics of being passive, low power consumption, and contactless. They are widely used in temperature monitoring, object detection, environmental monitoring and other fields. As a traditional measuring tool, contact sensors still play an important role in many fields, especially in applications that require accurate measurement of physical quantities (such as pressure, temperature, earthquake, etc.). With the advancement of technology, contact sensors are developing towards miniaturization, high precision, and standardized direction. For example, by integrating micro sensors and advanced material technology, future contact sensors will be able to provide higher-precision measurements in a smaller space. In addition, with the combination of the Internet of Things and artificial intelligence, the application of contact sensors will not only be limited to data acquisition, but will also be combined with functions such as intelligent analysis and real-time feedback, promoting their widespread application in medical, industrial automation, intelligent manufacturing and other fields.

The global Non-Contact Passive Sensor market size was estimated at USD 1199.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.60% during the forecast period.
