Abstracts

As the global electronics manufacturing industry enters a period of intensive innovation and rapid development of emerging enterprises, electronic components in the fields of consumer electronics and semiconductors are becoming more sophisticated. At the same time, new energy vehicles are becoming more intelligent, energy-saving, and connected to the Internet of Vehicles. It has promoted the rapid improvement of automobile electronics, the safety requirements for automobile electronics and power batteries have increased, and the requirements for dispensing process technology have become more and more stringent. It is required to control the extracted glue volume to be smaller, and the positioning accuracy of the dispensing device to be more precise. Precision, dispensing speed and consistency are further improved. With the improvement of global industrial level, the global electronic information manufacturing industry continues to develop in the direction of high precision, low power consumption, and high efficiency. The improvement of product accuracy, on the one hand, increases the requirements for processing accuracy and consistency. Some processes cannot continue to be performed manually and need to be replaced by electronic special equipment; on the other hand, higher performance and parameters of the electronic special equipment used for processing are proposed. Require. Closed-loop control is a flexible and high-performance control method that introduces PID algorithm and performs correction based on the output feedback of the control object. In the dispensing process, the feeding device of the dispensing equipment has built-in magnetic grid monitoring, which can detect the glue level difference at all times and output the monitoring data to the controller. The controller collects information from the supply end and the output end, and passes the PID The algorithm realizes closed-loop control and continuously adjusts the dispensing parameters related to the input and output of the glue liquid to achieve high-precision output and stability functions of the valve body and promote the development of the dispensing process in the direction of

automation and intelligence. The international trade situation has been changing in recent years. Factors such as my country's rising labor costs, uncertainty in Sino-US trade, and Southeast Asia's own policy support for the development of manufacturing have made the electronic information manufacturing industry begin to show a trend of moving to Southeast Asia. Electronic brands, with Apple as a typical representative, have begun to deploy production lines in Southeast Asia, and EMS manufacturers have also built factories in Southeast Asia to meet Apple's global production capacity layout. The update and iteration speed of downstream electronic products is accelerating, and the demand for flexibility in production lines is increasing. The electronic information manufacturing industry is developing at an accelerated pace in the direction of high precision and miniaturization, which puts forward higher requirements for the speed of production technology advancement. The changes in production processes brought about by technological progress will inevitably bring about the need for upgrading of intelligent manufacturing equipment. However, current smart manufacturing equipment generally features a high degree of customization. Therefore, the iteration of production processes has increasingly placed demands on the flexibility of production lines.
