Report Overview:

Non-Contact Temperature Sensors, whose the sensing element does not contact with the measured object, is also called as non-contact thermometers. This type of sensors is used to measure the temperature of moving objects, small objects or objects whose temperature change rapidly. And also be used for measurement of temperature distribution. Non-contact (infrared) temperature sensing reads temperature by intercepting a portion of the infrared energy emitted by an object or substance, and detecting its intensity. Non-contact is used to sense the temperature of solids and liquids, but cannot be used on gases due to their transparent nature.

The Global Non-Contact Temperature Market Size was estimated at USD 679.03 million in 2023 and is projected to reach USD 1530.11 million by 2029, exhibiting a CAGR of 14.50% during the forecast period.
