### Report Overview

The non-contact electric pen uses an I-shaped inductor as an antenna, and several three-stage tubes are combined into an amplifier circuit. One end of the inductance is connected to the B pole of the triode, and the other end is suspended in the air. When the inductor is close to the live wire, a weak current is induced. After being amplified by the triode, the LED is lit and the buzzer sounds, so as to determine the zero live wire. The non-contact electric pen uses inductive testing without physical contact to check the voltage on control lines, conductors and sockets or to check the location of open circuits along the wires.
