## Abstracts

Non-depolarizing muscle relaxants are a class of drugs that induce muscle paralysis by blocking the action of acetylcholine, a neurotransmitter that is necessary for muscle contraction. Unlike depolarizing muscle relaxants, which first cause an initial muscle contraction before inducing paralysis, non-depolarizing agents work by preventing acetylcholine from binding to its receptors at the neuromuscular junction, thus inhibiting the transmission of nerve impulses to the muscle. As a result, muscles remain relaxed and unable to contract.

The global Non-Depolarizing Muscle Relaxants market size was estimated at USD 1757.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
