Report Overview

A non-ferrous metal eddy current separator is a machine that uses a powerful magnetic field to separate non-ferrous metals from a stream of material. Non-ferrous metals are metals that are not attracted to magnets, such as aluminum, copper, and brass.

Eddy current separators work by creating a magnetic field that induces eddy currents in the non-ferrous metals. Eddy currents are electrical currents that flow in a closed loop around a magnetic field. The eddy currents create a repulsive force that pushes the non-ferrous metals away from the magnetic field.
