Report Overview

Non-ferrous metal scrap recycling refers to the process of recycling, purifying and reusing scrap or expired materials containing precious metals such as gold, silver, platinum, palladium, rhodium and other non-ferrous metals (such as copper, aluminum, lead, zinc, nickel, etc.) through professional institutions and professional technologies. Non-ferrous metal scrap refers to materials that have completed their service life or no longer meet the original use requirements during the production and consumption of non-ferrous metals and their alloy products. These scraps include scraps, cut heads, tails, waste products in the production process, and non-ferrous metal parts and materials discarded after consumption. Non-ferrous metal scraps can be re-refined into non-ferrous metals or their alloys through recycling, classification, pretreatment and smelting processes. This process is called recycled non-ferrous metal production. Recycled non-ferrous metals are similar to primary metals in performance, but the energy consumption and pollution in the production process are much lower than those of primary metal production, so they have important environmental and economic benefits.

The global Non-Ferrous Scrap market size was estimated at USD 131820 million in 2023 and is projected to reach USD 206255.60 million by 2032, exhibiting a CAGR of 5.10% during the forecast period.
