Abstracts

Non-fusion spinal devices represent a category of orthopedic implants designed to treat spinal pathologies such as degenerative disc disease, spinal stenosis, or instability while preserving motion at the treated segment, in contrast to traditional spinal fusion which rigidly immobilizes vertebrae. These devices include artificial discs for cervical or lumbar disc replacement, dynamic stabilization systems like pedicle screw-based flexible rods or interspinous process spacers, and other motion-preserving technologies that aim to reduce pain, maintain biomechanical function, and potentially lower the risk of adjacent segment degeneration associated with fusion procedures. The market for these devices is driven by an aging global population, rising prevalence of spinal disorders, advancements in material science and implant design, and growing patient preference for less invasive procedures with quicker recovery times, though it remains influenced by regulatory hurdles, reimbursement challenges, and the need for long-term clinical data to support efficacy and safety compared to fusion alternatives.

The global Non Fusion Spinal Devices market size was estimated at USD 5400.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
