Report Overview

Non-intrusive flow measurement is a technique used to measure the flow of fluids in a pipe without the need to cut into the pipe or interrupt the flow. This method typically employs sensors attached to the outside of the pipe, such as ultrasonic or electromagnetic sensors, to accurately gauge the flow rate. Non-intrusive measurement is advantageous because it minimizes downtime, reduces the risk of contamination, and is easier to install and maintain compared to intrusive methods. It is widely used in various industries, including water treatment, oil and gas, and chemical processing.
