Report Overview

The function of the brain is mainly studied by using techniques such as EEG or functional MRI. Brain stimulation method is also used to study the activity of the brain. The brain stimulation method comprises of repetitive Transcranial Magnetic Stimulation (rTMS) and Transcranial Current Stimulation (tCS). These two techniques are used to disrupt the activity of the brain as well as it is used to enhance the brain function. These two techniques are collectively known as non-invasive brain stimulation. The transcranial magnetic stimulation refers to the generation of magnetic pulses that easily transfer to the skull and other matter in the brain. The electrical potential is generated in the brain, depolarizing the neurons and triggering action potentials. The tCS involves the direct or alternating current, the pair of electrodes are placed over the head and one is placed over the target brain area.
