### Report Overview

Intracranial pressure (ICP) monitoring uses a device placed inside the head. The monitor senses the pressure inside the skull and sends measurements to a recording device. The monitoring of intracranial pressure is used in treating severe traumatic brain injury patients. This process is called intracranial pressure monitoring. All current clinical available measurement methods are invasive and use various transducer systems. Some non-invasive intracranial pressure measurement methods are currently being studied; these would facilitate diagnostics of traumatic brain injury or other causes of intracranial hypertension without the risks associated with invasive modalities.
