Abstracts

A Non Inverting Logic Buffer is an electronic component that amplifies and strengthens a digital signal without altering its logical state, meaning the output replicates the input exactly in both voltage level and logic value but with improved drive capability, noise immunity, and signal integrity, making it essential for isolating and driving subsequent stages in digital circuits, particularly where fan-out requirements exceed the capacity of a single logic gate or where long transmission lines introduce signal degradation.

The global Non Inverting Logic Buffer market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
