Abstracts

Non-isolated PWM controllers are integrated circuits used to regulate power conversion in electronic systems by generating pulse-width modulation signals that control switching transistors without electrical isolation between input and output, making them suitable for applications where input and output share a common ground and where cost, size, and efficiency are prioritized over safety isolation. These controllers are commonly employed in point-of-load converters, voltage regulator modules, and DC-DC converters within computing, telecommunications, consumer electronics, and automotive systems, offering advantages such as higher efficiency, simpler design, and reduced component count compared to isolated alternatives, while their operation typically involves feedback mechanisms to maintain precise output voltage regulation under varying load conditions.

The global Non Isolated Pwm Controllers market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
