Report Overview

Crystals that can produce nonlinear optical effects under the action of strong light or external fields (electric fields, magnetic fields, strain fields, etc.). Nonlinear optical crystals have nonlinear optical effects. When the incident laser light propagates in the nonlinear optical crystal, the 'frequency conversion' or 'frequency conversion' of the laser light occurs, that is, the wavelength of the output laser light is different from that of the incident laser light, thereby generating laser light with a new wavelength. Because the nonlinear optical crystal has the function of frequency conversion, it has the function of converting the fundamental frequency laser emitted by the laser working material into a variety of other wavelength lasers, thus enriching the wavelength of the laser, expanding the application field of the laser, and satisfying the needs of human beings. The need for multiple wavelengths of laser light.
