Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Non-Mercury Thermometers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Non-Mercury Thermometers are any temperature measuring devices designed for body temperature assessment that do not utilize the toxic metal mercury as their working fluid or sensing element. The widespread adoption of these thermometers is driven by the need to eliminate the environmental and health hazards associated with mercury spillage. Non-mercury thermometers are broadly categorized: those based on the principle of physical expansion, using non-toxic liquid metals like Galinstan (a gallium, indium, and tin alloy); and those based on electronic principles, employing thermistors (like digital stick thermometers) or infrared sensors (like ear and forehead thermometers) to measure and display the temperature. They are the preferred tool for safe and modern medical and household temperature monitoring. In 2024, global Non-Mercury Thermometers production reached approximately 105.3 million units, with an average global market price of around US\$ 7.91 per unit.

The global Non-Mercury Thermometers market size was estimated at USD 833.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
