### Report Overview

A non-opioid pain patch is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.

The global Non-opioid Pain Patch market size was estimated at USD 631.40 million in 2023 and is projected to reach USD 795.48 million by 2032, exhibiting a CAGR of 2.60% during the forecast period.
