## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Non-oriented Silicon Steel for New Energy Vehicle competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Non-oriented silicon steel has homogeneous magnetic properties in all directions. They are used as core materials in rotating machines, from tiny precision electric motors to large power generators. This type of steel is particularly important for new energy vehicles (NEVs). The use of non-oriented silicon steel enhances the efficiency and performance of electric drivetrains, a critical aspect of NEV technology. The global transition from internal combustion engine (ICE) vehicles to electric vehicles is a major driver for NGO silicon steel. As NEV sales rise, the demand for efficient electric motors, which rely on high-performance materials like NGO silicon steel, also increases. This trend is fueled by consumer demand for greener transportation options, government incentives, and regulatory pressures aimed at reducing greenhouse gas emissions. As the adoption of NEVs accelerates globally, the demand for NGO silicon steel is growing. Emerging markets, especially in Asia, are seeing an increase in NEV production, with countries like China, India, and South Korea playing key roles in driving this demand. As these markets grow, the need for high-performance materials like NGO silicon steel will continue to rise. There has been ongoing research and development in electric motor technology, leading to the production of more efficient and powerful motors. This includes advancements in materials, design, and manufacturing processes, resulting in lighter, more compact, and higher-performing motors. One of the primary goals in electric motor design for NEVs is reducing core losses, as these directly affect motor efficiency and driving range. As a result, manufacturers are focusing on using thinner NGO silicon steel, which helps

minimize eddy current losses (energy wasted as heat).

The global Non-oriented Silicon Steel for New Energy Vehicle market size was estimated at USD 2974.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
