Abstracts

Non-oxidising furnaces, also known as controlled atmosphere or inert atmosphere furnaces, are specialized industrial heating systems designed to process materials?typically metals, ceramics, and advanced composites?in environments where oxygen or other reactive gases are excluded or carefully regulated. These furnaces create an oxygen-free or low-oxygen atmosphere using inert gases like nitrogen or argon or reducing gases such as hydrogen or cracked ammonia to prevent oxidation, decarburization, or other undesirable chemical reactions during heat treatment processes like sintering, brazing, annealing, or hardening. By maintaining precise atmospheric conditions, they enable the production of components with improved mechanical properties, surface integrity, and dimensional stability, making them essential in industries such as aerospace, automotive, electronics, and medical device manufacturing where material purity and performance are critical.

The global Non Oxidising Furnaces market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
