## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Non-precious Metal Low-temperature SCR Catalysts competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of non-precious metal low-temperature SCR catalysts reached 28,859 cubic meters, with an average selling price of US\$6,729 per cubic meter. Non-precious metal low-temperature SCR catalysts are catalytic materials with non-precious metals (such as transition metal oxides MnOx, CeO<sub>2</sub>, Fe<sub>2</sub>O<sub>3</sub>, and perovskite-type oxides LaCoO<sub>3</sub>) as the primary active component. They can efficiently catalyze the selective reduction reaction (NH<sub>3</sub>-SCR) of ammonia (NH<sub>3</sub>) and nitrogen oxides (NO<sub>x</sub>) at relatively low temperatures (typically 150-300°C), producing harmless nitrogen (N<sub>2</sub>) and water (H<sub>2</sub>O). By regulating the redox properties, surface acidity, and crystal structure (such as oxygen vacancy concentration and active species adsorption capacity) of the active components, this design overcomes the high-temperature activity limitations of traditional precious metal (Pt, Pd) catalysts, significantly improving catalytic efficiency and resistance to sulfur and water poisoning at low temperatures. It is widely used for NO<sub>x</sub> purification in low-temperature emission scenarios such as diesel exhaust, industrial boilers, and cement kilns.

The global Non-precious Metal Low-temperature SCR Catalysts market size was estimated at USD 194.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
