Report Overview

Non-raphitizable carbon refers to a type of carbon material that cannot transform into graphite under normal conditions, unlike graphitizable carbon materials. non-raphitizable carbon materials maintain an amorphous or non-graphitic structure even at high temperatures. These materials possess different properties compared to graphite, including lower thermal and electrical conductivity but higher mechanical strength and chemical resistance. Non-raphitizable carbon materials are commonly used in applications where their unique properties are advantageous, such as high-temperature insulation, friction materials, electrodes, and structural components.
