Abstracts

A Non-Replicating mRNA Vaccine is a vaccine based on messenger RNA (mRNA) technology, characterized by the use of mRNA that does not replicate within the recipient's body. This vaccine delivers mRNA encoding specific antigens (such as proteins on the surface of viruses) to human cells, prompting them to produce protein fragments of these antigens. This, in turn, stimulates the immune system to generate an immune response against these antigens, such as antibody production and T-cell activation. Due to its non-replicating nature, the vaccine is highly safe and does not cause infection or disease. Non-Replicating mRNA Vaccines have been widely used in the COVID-19 pandemic, demonstrating their advantages of rapid development, efficient production, and easy distribution.

The global Non-Replicating mRNA Vaccine market size was estimated at USD 1476.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
