Report Overview

The widely used non-resorbable barrier membranes are made of polytetrafluoroethylene (PTFE), expanded polytetrafluoroethylene (e-PTFE), titanium (Ti), and titanium-reinforced PTFE (Ti-PTFE) . Various fabrication methods are used to create dense or porous variations of these materials. Because they are biologically inert and chemically stable, PTFE and e-PTFE were appealing first-generation biomaterials for use in GBR and GTR procedures. Although PTFE and titanium are non-resorbable and require a second surgery, surgeons continue their use due to their surgical handling properties, malleability, structural rigidity in preventing collapse, and space maintenance for large ridge defects.
